I (Prolific) The Prolific U232-P9 (2.4) USB-RS232 Port is more expensive than any other driver available but a great solution for debugging your projects. PC Descriptions: Prolific U232-P9 USB Driver (COMPATIBLE WITH WINDOWS & LINUX). A: Looks like you've found an outdated driver. The two ports I am familiar with and I know of are the following: The RS232 port (registers at U232-P3) is a COM port and is hard-wired in the USB adapter, not serial, so there is no free separate RS232 port. The USB port is auto-detected and the data is received and sent through a USB port (com 5). The RTS and CTS lines are in the data stream and the COM port uses these to determine if the data is to be sent (called an RS232 handshake), so you need to watch the receiving serial stream to see if it becomes longer than 6 characters long, indicating data is being received. I have not found any specific drivers for the Prolific. A: thanks for the links, and I will check that out as well as as many of the other postings I was able to find. Before we get into the specifics of the above links, I just want to let you know this is a very complex subject. I am working with a USB to RS232 adapter, and it just got much more complex. On a linux desktop I was using an old Prolific USB to Serial Adapter, and it could be connected to a serial console in the terminal, and displayed incoming data as well as help. I plugged the same adapter in a windows platform. (windows xp 64 bit, win 10, win 7 - (haven't tried any others)) When I plugged

it in, I could see the serial port open. I tried to view the data, and even if it would send any data, it would not show in the serial. (same terminal as before) Then I double clicked on the device manager and saw that the COM port I had connected it to was called RS232 R f678ea9f9e
